                                                                                                                                                                                                                                                                                                                                                              This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (IRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding IRH1 (also known as NR5A2). IRH1 is a monomeric orphan unclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside congrounded that comprise at least one modified internucleoside inkage, a phosphorothicate linkage, at least one modified sugar moiety, a 2-0-methoxyethy1 (2' MOB) and at least one modified sucleobase, a 5-methyloytidine. These antisense compounds are useful for treating or diagnosing a disease associated with IRH1, such as breast cancer, diagnosing a disease associated with IRH1, such as breast cancer, the individual density lipoprotein), hypercholesterolaemia, gall stones, till low density lipoprotein), hypercholesterolaemia, gall stones, triglyceridemia, obesity, hepatitis B virus-mediated acute or chronic hyperchical and a secondated with the factors of the factor of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human; ss; liver related homologue-1; LRH1; NR5A2; antisense; homosphorothioate; 2' MOS; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; gall stone; triglyceridaemia; obesity; hepatitis; hepaticular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiinflammatory; virucidal.
                                                                                                                                                                                   New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antiinflammatory and virucidal activities. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligonucleotide sequence is an antisense DNA oligo used to modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense DNA oligo used to modulate human LRH1 expression SeqID 1493.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to antisense compounds targeted to nucleic acids encoding buman Fas (also known as Apo-1 or CD95), Fas ligand (Fasi, also Apo-1L and CD95L), and Fas associated protein 1 (Fap-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits Fas, FasL or Fap-1 mediated as signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MoE) sugar moiety. The antisense oligonucleotide further comprises at least one modified mucleobase, preferably a 5-methyloytosine. The antisense conjecundate is motified anticomment of autoimmune or inflammatory diseases, and cancers associated with overexpression of or constitutive activation of Fas, FasL, or Fap-1. The present sequence
Fas associated protein 1; Fap-1; signal transduction; autoimmune disease; inflammatory disease; cancer; immunosuppressive; antiinflammatory; cytostatic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotides of 20-50 nucleobases, useful for treating
                                                                                                                                                                                                                                                                                                                                                 /note = "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOB) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 represents an antisense oligonucleotide used in the examples of present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human endothelial lipase antisense oligonucleotide, SEQ ID 2512.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 13.6; DB 1; Length 20; Pred.                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER
/note= "This Oligonucleotide has a phosphorothicate
backbone and 2- methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy, Human, Endothelial Lipase, dyslipidaemia, high density lipoprotein, HDL, cardiovascular disorder, metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25511), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotide for modulating endothelial lipase

```

```
The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound a compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, condition trom burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorchhioate oligonucleotide with 2 MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding about.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonuclectide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                          /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprottin (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache;

with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 5799; 417pp; English

nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder including but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target invention relates to an antisense compound targeted to human Navi.3 expression, the oligonucleotic different regions of the human Navi.3 RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) co-cegulated chemokine—I (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues comprising contracting the cells or tissues with the antisense compound and a method of traating a human cortissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising contacting the antisense compound and a method of treating a human of vCC-1. The antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonuclectide comprises at least one modified sugar moiety, preferably a 2.-0-
comprises at least one modified sugar moiety, preferably a 2.-0-
comprises at least one modified sugar moiety, and at least one modified nucleobase,
comprises at least one condition. The antisense oligonuclectide preferably is a chimeric oligonuclectide. The antisense oligonuclectide preferably is a chimeric oligonuclectide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, an angiogenic

The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in calls or tissues compraing contacting the cells or tissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising
                                                                                                     healing of bone fractures and cartilage danage, for regeneration of tissues or organs, for treating periodontal diseases, for gut protection or regeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; VEGF co-regulated chemokine-1; VCC-1; vascular endothelial growth factor; ss; antisense compound; phosphorothicate linkage; 2'-0-methoxyethyl sugar moiety; b-methylcytosine, antisense oligonucleotide; diabetes; immunological disorder; cardiovascular disorder; neurological disorder; ischaemia; reperfusion injury; cancer; angiogenic disorder; haemangioma; tummour angiogenesis; theumatoid arthritis; atherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture; cartilage damage; tissue regeneration; organ regeneration; periodontal disease; gut regeneration; atrial fibrillation.

administering the antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl sugar moiety, and at least one modified nucleobase, comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl sugar moiety, and at least one modified nucleobase, compromined to a modifically a 5-methylcytosine. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, companied disorder, a neurological configuration injury, cancer or an angiogenic disorder, e.g. haemangioma, tumour angiogenesis, rheumatoid arthritis, disorder, e.g. haemangioma, tumour angiogenesis, rheumatoid arthritis, confiscence oligonucleotides may also be used for wound healing, for catheroscierosals, psoriasis or fibrosis after myocardial infarction. VCC-1 antisense oligonucleotides may also be used for regeneration of tissues or organs, for treatment of lung or liver fibrosis or for treatment of lung or liver fibrosis or for unargement of atrial fibrillation. This sequence represents an antisense of vigonucleotide targeted to DNA encoding the human VCC-1 polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

administering the antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorochioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl sugar moiety, and at least one modified nucleobase, specifically a 5-methyloycosine. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, e.g. haemangioma, tumour angiogenesis, rheumatoid arthritis, disorder, ischaemia, reperfusion injury, cancer or an angiogenic catheroscalerosis, psoriatis or fibrosis after myocardial infarction. VCC-1 antisense oligonucleotides may alone be used for wound healing, for catheroscalerosis, psoriates may alone be used for wound healing, for centisense oligonucleotides may alone or regeneration of itssues or organs, for treating periodontal diseases, for gut protection or regeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                               molecule encoding human vascular endothelial growth factor (VEGF) co-
regulated chemoKine-1 (VCC-1), and which specifically pybridises with and
inhibits the expression of VCC-1. The invention also relates to a
composition comprising the antisense compound, a method of inhibiting the
expression of VCC-1 in cells or tissues comprising contracting the cells
or tissues with the antisense compound and a method of treating a human
having a disease or condition associated with VCC-1 comprising a human
                                            invention relates to an antisense compound targeted to a nucleic acid

The invention relates to an antisense oligonucleotide targeting human intercellular adhesion molecule (ICAM-1) having a sequence appearing as ADM46473. In the oligonucleotide, at least one adenosine nucleotide is replaced with a thymidine, cytidine or guanosine nucleotide, at least one thymidine nucleotide is replaced with an adenosine, cytidine or guanosine thymidine, thymidine nucleotide is replaced with an adenosine, cytidine or guanosine nucleotide is replaced with an adenosine, cytidine or guanosine concliction. The oligonucleotide is one of 88 disclosed antisense coligonucleotides targeting ICAM-1, vascular cell adhesion molecule (VCAM-1) or endothelial leukocyte adhesion molecule (ELAM-1). Also included are an RNA compound 8-80 nucleobases in length targeted to human ICAM-1 mRNA and inhibits the expression of human ICAM-1 mRNA, and adunble stranded continuity to expression of human ICAM-1 mRNA, and adunble stranded continuity the expression of human ICAM-1 mRNA, and adunble stranded continuity is seen in some metabolism of specific cell adhesion molecules. It is also useful for the diagnosis, as research cand the modulation of the synthesis and metabolism of specific cell adhesion molecules. It is also useful for the diagnosis, as research continuity reduces including redness and inflammation caused by allergens and disorders including redness and inflammation caused by allergens and allergic reactions. The oligonucleotides can allograft rejections. The conneal explants ex vivo and to prevent corneal allograft rejections. The specific reactions which expert corneal allograft rejections. The specific hybridisation exhibited by the oligonucleotides may be used for specific hybridisation exhibited by the oligonucleotides may be used for specific hybridisation exhibited by the oligonucleotides may be used for assays, purifications or cellular product preparations. The specific center or conneal explants or cellular product preparations. The specific hybridisation exhibited by the oligonucleotides may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotide, useful for diagnosing, as research reagents and for treating disease states, which respond to modulation of the synthesis or metabolism of cell adhesion molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.8%; Score 13.6; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an antisense compound 8-30 or 8-50 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding Fas, Fas ligand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent; a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Pap-1; anda preventing allograft rejection, ischaemia reperfusion injury or apoptosis in an allograft recipient. The antisense compound and pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammatory disease, e.g. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis allograft rejection, e.g. cardiac, renal, hepatic or skin allograft and ischemia reperfusion injury. This sequence represents a human Fas ligand (FasL) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to a compound targeted to a nucleic acid molecule encoding the human transcription factor Dp-1 polypeptide. The compound is an antisense oligonuclecide that specifically hybridises with the nucleic acid molecule encoding transcription factor Dp-1 and inhibits expression of the polypeptide. The antisense oligonuclecide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2.0-nethoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of transcription factor Dp-1 and for preventing or treating developmental disorders, hyperproliferative disorders (i.e. cancer, particularly lymphoma), and diseases or conditions that arise as a result of aberrant apoptosis. The antisense compounds may also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides inhibiting the expression of transcription factor Dp-1, useful for preventing or treating diseases associated with transcription factor Dp-1, such as developmental or hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           interleukin 13; IL13; immunology; molecular biology; autoimmune disease;

```

The present invention describes a method for determining an individual's risk for type I diabetes. The method comprises detecting the presence of a type I diabetes. The method comprises detecting the presence of a type I diabetes associated polymorphism in the interleukin 4 (ILI4) or ILI3 loci in a nucleic acid sample of the individual, where the presence of the polymorphism indicates the individual's risk for type I diabetes.

CC ILI3 loci in a nucleic acid sample of the individual, where the presence of the polymorphism individual's risk for type I diabetes.

CC omprising one or more sequence-specific oligonucleotide each conditions to use the kit to determine the individual's risk for type I diabetes becomes the kit to determine the individual's risk for type I diabetes. Detection of one or more IL4 or ILI3 polymorphism, and instructions to use the kit to determine the individual's risk for type I diabetes. Detection of one or more IL4 or ILI3 polymorphisms in a nucleic acid sample of an individual, is useful for the determination of the Individual's risk for type I diabetes. The methods and compositions of individual's risk for type I diabetes. The methods and compositions of comportation are also useful in the field of immunology and concount invention are also useful in the field of immunology and concount into a sample of a utoimmune diseases, such as multiple sclerosis, myasthemia gravis, concount in the presents a primer for human IL4 receptor (IL4R), which is used in the composition of the present invention. The human IL4R gene is located multiple sclerosis; myasthenia gravis; ulcerative colitis; permicious anamia; rheumatoid arthritis; systemaic lupus erythematosus; inflammatory bowel disease; human; interleukin 4 receptor; IL4R; primer; ss; single nucleotide polymorphism; SNP; chromosome 16. Detecting an individual's risk for autoimmune diseases, in particular type 1 diabetes, by determining sequence variants or polymorphisms present at the  $\rm IL-4$  and  $\rm IL-13$  loci.                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for the diagnosis of, or identification of a predisposition to, ovarian endometriosis. Specifically, it refers to identifying differentially expressed ovarian endometriosis associated (OEX) genes that are up- or down- regulated compared to a control. The present invention describes a comprehensive CDNA microarray system to identify differentially expressed OEX genes such as tissue factor pathway inhibitor-2 (TFPI-2) and intelectin (ITLN). Accordingly, cytostatic pharmaceutical compositions can be targeted to the identified OEX genes as appropriate. Furthermore, it provides methods, kits and compositions for the development of waccines to treat or prevent voarian endometriosis. This oligonuclectide sequence is an RT-PCR primer used to amplify human GAPDH as a control, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Embryonic stem cell; ES cell; pancreatic islet-like cell; type I diabetis; nerve-like cell; nerve function; cell therapy; reverse transcription; RT; PCR; primer; mouse; ss; cell differentiation;

```
mammalian embryonic stem (ES) cells into functioning cells. The method is useful for inducing differentiation of mammalian ES cells into functioning oells. The parcreatic islet—like cell clusters induced from allogenic ES cells are useful for treating a mammalian patient having disorders in pancreatic islet function, such as when the patient having cells can be used for treating a mammalian patient is a type I diabetic patient. The nerve-like cells induced from allogenic ES cells can be used for treating a mammalian patient having disorders in nerve function. The method is also useful in cell therapy. The present sequence is a reverse transcription (RT)-PCR primer used to amplify mouse SHH signal receptor, patched (Ptc) cDNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                      Inducing mammalian embryonic stem (ES) cell differentiation into functioning cells, for treating e.g. diabetes, by culturing mammalian ES cells in a medium having leukemia inhibitory factor and basic FGF to give
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                         The present invention relates to the method for making an artificial neural network embodied on a computer-readable medium for predicting antisense activity of oligonuclectides for down-regularing expression of a selected RNA. The invention provides a five-fold reduction in the number of oligonuclectides to be screened in vivo to find effective targets. The present sequence is human ICAM-specific antisense oligonuclectide. This sequence is used in the invention.
Predicting antisense activity of an oligonucleotide for down-regulating expression of an RNA, comprises developing an artificial neural network, determining counts of mapped sequence motifs, and obtaining a output of

The invention relates to an isolated polypeptide (designated NOVX, or NOV1-NOV127) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also included are an isolated mucleic acid molecule encoding NOVX, a vector comprising the presence or amount of the polypeptide or the mucleic acid molecule in a sample, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying an agent that binds to the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying a potential therapeutic agent for cost in the treatment of a pathology that is related to aberrant expression or physicological interactions of the polypeptide, a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating the activity of the polypeptide cited above. The composition and methods are useful for diagnosing, preventing or treating diseases such as diabetes, obesity, infectious diseases, anorexia, cancer-associated cachers, cancer, neurodegenerative disorders, lates may also be used in the pharmacogenomics. The polypeptides are also useful as vaccines. The pharmacogenomics. The polypeptides are also useful as vaccines. The pharmacogenomics are also useful as vaccines and a set also used and a set also useful as vaccines. The pharmacogenomics are also useful as vaccines are also useful as vaccines. The pharmacogenemics are also useful as vaccines are also useful as vaccines and a set also useful as vaccines are also are also useful as vaccines are also are also useful as vaccines are also are also ar

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to human mPGES-1 gene is located on chromosome 9, more specifically to having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisabse oligonucleotides and antisense compounds have cytostatic, antisabse oligonucleotides and antisense compounds have cytostatic, antisinamatory, neuroprotective, nootropic, antiarthritic, vasotropic, antinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or displaced as mpGES-1 with mPGES-1 e.g., inflammation, also and antisense compounds and antiseic anticities and also and also anticities and also anticities and anticities and also antici
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Gierse JK;

ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diaberes, cancer, ischaemia or repertusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder. The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, mPGES-1 in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,

baving a sequence comprising 8-30 bp targeted to a nucleic acid encoding the more a medically hybridise with the nucleic acid medgal-1 and inhibits its expression; [2) a method of inhibiting the expression of medgal in cells or tissues; and (3) a method of treating an animal adjaces or condition associated with medgal. MpGBS-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiahertic, immunomodulator, cardiant, neuroprotective, antidiahertic, immunomodulator, and an encaperate activities, and can be used as mpGBS-1 inhibitors and in gene therapy. The antisense compound to be used as mpGBS-1 inhibitors and in gene therapy. The antisense compound a disease or condition associated with mpGBS-1 e.g., inflammation, Alzheimer's condition associated with mpGBS-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemia or reperfusion injury, or cophthalmic, immunological, cardiovascular or neurological disorder.

The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; notiropic; ophthalmological;
                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human megas.

Human megas.1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding megas.1, which specifically hybridise with the nucleic acid megas.1 and inhibits its expression; (2) a method of inhibiting the expression of megas.1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with megas.1.
                                                                                                               New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mFGES-1). The human mFGES-1 gene is located on chromosome 9, more specifically to operate on the present invention also describes: (1) antisense compounds, having a sequence comprising 0.30 by targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antistabetic, immunomodulator, cardiant, neuroprotective, captural carivities, and cantiniflammatory, neuroprotective, nootropic, antisthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound is condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, injury, or other presents of the properties o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The method comprises analysis the genotype of specific gene polymorphisms in a clinical nucleic acid sample. The gene polymorphisms in a clinical nucleic acid sample. The gene polymorphisms analysed are one or both of the following two sets: variation at base 1648 of glycoprotein la gene, variation at base 190 of chemokine receptor 2 gene, variation at base 825 of G-protein beta3 subunit gene, and variation at base 825 of or protein beta3 subunit gene, and base -830 of tumour necrosis factor alpha gene, variation at base sets factor alpha gene, variation at base 138 of tumour necrosis factor alpha gene, variation at base 138 of tumour necrosis factor alpha gene, variation at base 138 of tumour necrosis factor alpha gene, variation at base 1018 of glycoprotein which is referred to in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                             Analysis of specific single polynucleotide polymorphisms in a patient for prediction of the genetic risk of developing hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for prediction of genetic risk

The invention relates to SAC1 polypeptides and the polynucleotides concain a variation associated with sensing carbohydrates, other sweeteners or ethanol. The invention also relates to a method for analysing a biomolecule in a biological sample, comprising altering SAC1 activity in the sample and measuring the activity, a method for analysing a polynuclectide in a biological sample, comprising contacting a polynuclectide in a biological sample, comprising contacting a polynuclectide in a biological sample, comprising contacting a polynuclectide in a biological sample, a comprising contacting a polynuclectide in a biological sample, comprising contacting a polynuclectide in a biological sample, a comprising contacting susceptibility to obesity or diabetes comprising comparing of identifying susceptibility to obesity or diabetes comprising comparing the nuclectide sequence of the suspected SAC1 allele with a wild type nucleotide sequence, and a method of treating or preventing obesity, diabetes or alcoholism associated with expression of EAC1, comprising administering to a subject a pharmaceutical composition and a transgenic animal that carries an altered SAC1 allele. The methods and compositions of the invention are useful for screening drawing for inhibition or restoration theraples and for identifying sweeteners and alcohols. This subject represents a PCR primer used to amplify human SAC1 by a primer used to amplify human SAC1 by an activation of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotides for sensing carbohydrates, other sweeteners, or ethanol, useful for screening drugs for inhibition or restoration of gene function as antidiabetic, antiobesity or antialcohol consumption

The present invention describes using a leukotriene synthesis inhibitor in an individual conflict infarction or susceptibility to myocardial infarction in an individual.

Also described is a method (MI) for the treatment of acute coronary syndrome (ACS) in an individual comprising administering (I). (I) has contained an individual administering (I). (I) has an individual comprising administering (I). (I) has contained an individual activities, and can be used as a leukotriene biosynthesis inhibitor, and a leukotriene receptor antagonist. (I) can be use for the manufacture of a medicament for the infarction in an individual infarction, an at-risk haplotype for myocardial infarction, an at-risk haplotype for myocardial infarction, an at-risk haplotype in an individual infarction, an at-risk haplotype in a Filap nucleic acid and an at-risk polymorphism in the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a FLAP nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-LO) gene promoter, in an individual who has at least one risk factor chosen from diabetes, hypertension, hypercholesterolaemia, elevated inflammatory marker chosen from Creactive protein (CRP), serum amyloid A, fibrinogen, leukotriene, leukotriene metabolite, interleukin-6, tissue necrosis factor-alpha, soluble vascular cell adhesion molecule (8VCAM), soluble intervascular adhesion molecule (16CAM), Eselectin, matrix metalloprotease type-1, matrix metalloprotease type-2, matrix metalloprotease type-1, matrix metalloprotease type-3 and matrix metalloprotease type-9, in a nindividual having increased low density lipoprotein (IDL) cholesterol in an individual having increased low density lipoprotein (10L) cholesterol in an individual having increased low density lipoprotein correction in an individual having increased low density lipoprotein correction in an individual having increased low density lipoprotein correction in an individual having increased lipoprotein elevance of and/or decreased in individual having increased li event, stable angina; or in an individual who has atherosclerosis or who requires treatment to restore blood flow in arteries. (M1) is useful for treating an individual suffering from acute coronary syndrome chosen from unstable angina, non-ST-elevation myocardial infarction (NSTEMI) and ST-elevation myocardial infarction (STEMI) and ST-elevation myocardial infarction (STEMI). The human FLAP gene is located on chromosome 13, more specifically to 13q12. The present sequence having previous myocardial infarction or acute coronary syndrome (ACS)

New antisense oligonucleotides useful for modulating expression of Farnesold X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders, e.g. diabetes, immuno gallstones or obesity

Claim 4; SEQ ID NO 2012; 150pp; English.

The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein) elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertidenta, obesity, hypertidesterolemia, gallstones, hypertidesom injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the

The invention describes a method of identifying a compound that induces senescence in a mammalian cell. The method comprises: culturing the mammalian cell in the presence and absence of the compound; assaying carperession of at least one cellular gene selected from 73 genes given in the specification, in the cell in the presence and in the absence of the compound; and identifying compounds that induce senescence when capteression of at least one of the compound. Also described are:

Compound that induces senescence in a mammalian cell identified from the method above; assessing efficacy of a treatment of a disease or condition relating a compound that induces senescence in a mammalian cell identified from the method above; assessing efficacy of a treatment of a disease or condition relating a compound that inhibits senescence associated in duction of cellular gene expression. Compounds that induce senescence in abnormally proliferating or neoplastic cells are useful for treating a disease or condition relating to abnormal cell proliferation or neoplastic cells are useful for treating a neoplastic cells are useful for treating a compounds that induces transcriptase por neoplastic cells in abnormal used to identify genes induced and repressed follwing compounds repressed follwing compounds repressed follwing compounds that induced cells are useful for treating a compound that induced sensescence condition relating to abnormal cells.

The invention relates to antisense oligonucleotides targeted to cyclindependent kinase 6, and which inhibit the expression of cyclin-dependent kinase 6. The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and disgnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonucleotide. Note: Seqid 15-134 are also used in the sequence listing but these sequences do not match seqid 15-
                                                                                                                                                                                                                                                                                                                                                                                         /note= "Phosphorothioate backbone. All cytidines are 5-methylcytidines."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding cyclin-dependent kinase 6, useful for treating cancer, bacterial/viral infection or conditions involving aberrant

Diseases, include anemia, myeloproliferative disorders, hemorrhagic disorders, leukemia, myeloproliferative disorders, Alzheimer's disease, Pick's dementia, multiple sclerosis, stroke, Alzheimer's disease, Pick's disease, dysphagia, jaundice, intrahepatic cholestatis, hepatomegaly, sthma, systemic lupus erythematosus, myasthenia gravis, diabetes, rheumatoid arthritis, sporiasis, scleroderma, urinary incontinence, erectile dysfunction or pelvic pain. This sequence represents the forward PCR primer to amplify the GRP43 gene of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human nucleic acid sequences (I; ADD15739-ADD15912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (I) is useful for prognosing and determining the progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..
                                                                                                                                                                                                                                          New compound targeted to a nucleic acid molecule encoding huntingtin interacting protein 2 and inhibits the expression of huntingtin interacting protein 2, useful for modulating the expression of huntingtin interacting protein 2.
                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molecule encoding human huntingtin interacting protein 2. The compound is an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage is a least one modified internucleoside linkage preferably a 2.0-methoxyethyl sugar moiety, or at least one modified mucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human huntingtin interacting protein 2 polypeptide and in preparation of a composition for treating neurodegenerative disorders. This sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human huntingtin interacting protein 2 DNA antisense oligonucleotide #28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; huntingtin interacting protein 2; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; neurodegenerative disorder; neuroprotective.

```
New compound targeted to a nucleic acid molecule encoding huntingtin interacting protein 2 and inhibits the expression of huntingtin interacting protein 2, useful for modulating the expression of huntingtin interacting protein 2.
                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound targeted to a nucleic acid molecule encoding human huntingtin interacting protein 2. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage is a posphorothicate linkage, at least one modified sugar moiety, preferably a 2. O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are protein 2 polypeptide and in preparation of a composition for treating neurodegenerative disorders. This sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oligonucleotide targeted to DNA encoding the human huntingtin interacting

```
The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding inhibitors of apoptosis [IAP)-like, where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the encoding IAP-like in cells or tissues; screening for a modulator of IAP-like; a clissues; screening for a modulator of the primers selected from 2 sequences comprising the expression of the probe comprising small having a disease or condition associated with IAP-like. It is also useful for modulating the expression of IAP-like. It is also useful for diagnosing or treating diseases associated with expression of IAP-like, e.g. a hyperproliferative disorder. This sequence comprises the modulator of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compound targeted to a nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like and inhibits expression of IAP-like, useful for modulating the expression of IAP-like or for treating, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Galactin-3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RT-PCR, mouse; murine; primer; ss; Mm28913; immunoregulation; immunity balance; Th1 helper T cell; Th2 helper T cell; C/EBP (alpha); GATA-4; NOCh-4; IRS-4; placental Ca2+ binding protein; Cb6; Galactin-3; Cb7; DEC1; Onzin; GBP3; CD49b; CD29; BMP-10; integrin(beta) 7; PCSR3; GP49A; CTLA-2(alpha); TDAG51; CD53; laminin(alpha)5; PPAR(gamma); ECM1; CRABP2; CYP11A(P4508CC); 20(alpha)-hydroxysteroid dehydrogenase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like, where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the cocciding IAP-like and selected are: inhibiting the expression of IAP-like in cells or tissues; screening for a modulator of IAP-like; a diagnostic method for identifying a disease state comprising identifying the presence of IAP-like in a sample using at least one of the primers selected from 2 sequences comprising SEQ ID NO. 5 or 6, or the probe comprising SEQ ID NO. 7, a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like.

It is also useful for diagnosing or treating diseases associated with expression of IAP-like, e.g. a hyperproliferative disorder. This sequence of importors of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel gene identified as Mm28913 and the encoded protein thereof that is involved in immunoregulation activity. Specifically, it refers to a method to test for the immunity balance or ratio between Th1 and Th2 helper T cells. The present invention describes the target helper T cells. The present invention describes the target helper T cells. The present invention describes the target helper T cells. The present invention describes the target helper T cells follow (Alpha), GATA-4, Notch-4, IRS-4, DIGD-4, DEC1, ODZ1, DEC1, ODZ1, DEC1, ODZ1, ODZ1, DEC1, ODZ1, ODZ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel Mm28913 and Mm20021 nucleic acid sequences encoding protein with immunoregulation activity, useful for evaluating ratio of Th1/Th2 helper

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 seequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2' PMC wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (SPAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;
                                                                                                                                                                                                                                                                with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comparise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition, associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2' MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                         The present invention relates to a compound which specifically hybridizes
                                                                                                                                                                                New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GRMT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are artisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2' MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                              The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 30G3 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                        New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding glutamine-fructose-6-phosphace amidotransferase
(RPMT), for treating diabetes, a cardiovascular or neurologic disorder
ischemia/reperfusion injury.

They are also useful in research and diagnostics for modulating the expression of GPAT. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition.
                                                                                                                                                                         New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAI), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GPAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligomocleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorochicate oligonucleotide with 2-MOE wings and a deoxy gap, these
                                                                                                                                         New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
(GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transplant rejection; immune system; rheumatoid arthritis; lupus; inflammatory bowel disease; multiple sclerosis; HIV; AIDS; ss; primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     d
                                                                                                                                                                                                                                                                                                                      The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2. MOB wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slebt, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or primal, bacterial or fungal infection. The present sequence represents a primal, bacterial or fungal infection. The present sequence represents a primar, for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing or monitoring transplant rejection, e.g. heart, kidhey, liver, panoreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic sleat, lung, bone marrow or stem cell transplant rejection, e.g. heart islet, lung, bone marrow or stem cell transplant rejection, in ar xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonuclee marker for diagnosis and monitoring of allograft rejection and other disorders.
              individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a Tagman probe for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.

```
The invention relates to a compound targeted to a nucleic acid molecule encoding the human Notch3 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibite expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified signa moiety, preferably a 2'-O-methoxyethy1 sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of the human Notch3 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Notch3 DNA antisense
                                                                                                                                                                                                                                                                                                                                                              Human; Notch3; ss; antisense oligonucleotide; phosphorothioate linkage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound targeted to a nucleic acid molecule encoding the human Notch3 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide phosphorothicate at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-o-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of the human Notch3 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Notch3 DNA antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypotensive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense 2'-MOE gapmer oligo targeted to human ApoB RNA - SEQ 52

                                                                  The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80% confluent HepG2 cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, antiarteriosclerotic, antilipaemic, antidiabetic, anorectic, cardiant, vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic, cendocrine, vasotropic, neuroprotective and nootropic activities and may be useful for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal clipid or cholesterol metabolism. The compound may be useful for decreasing circulating lipoprotein levels, triglyceride levels, cholesterol levels, lipid levels, fatty acid levels, acute phase conditions and chylomicrons and thus may be utilised during treatment of the compound conditions and chylomicrons and thus may be utilised during treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reactants and chylomicrons and thus may be uniformally hyperlipoproteinaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia, anorexia nervosa, Werner's shall hepatoma, multiple myeloma, uraemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               impotence, obstructive liver disease, Alzheimer's disease, dementia, diabetes, obesity and atherosclerosis. The current sequence is that of an antisense 2'-MOB (2'-methoxyethyl) gapmer oligo of the invention which is
Von Gierke's disease; lipodystrophy; Cushing's syndrome; sexual ateliotic dwarfism; hyperthyroidism; hypertension; anorexia nervosa; Werner's syndrome; hepatoma; multiple myeloma; uraemia; impotence; obstructive liver disease; Alzheimer's; dementia; diabetes; obesity; atherosclerosis; antisense; 2'-MOB gapmer; 2'-methoxyethyl wing; phosphorothioate backbone; human; chromosome 2p23-2p24; ss.
                                                                                                                                                                                                                                                                                            /note= "OTHER = Phosphorothioate backbone, bases 1-5 and 16-20 2'-MOE wing bases, all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotide compound that inhibits expression of mRNA encoding human apolipoprotein B, useful for treating hyperlipidemia, diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's

The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of MIMA-related kinase 6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioare linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety, interner oligonucleotide further comprises at least one modicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hyperproliferative disorders, e.g. cancer. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                         moiety. The antisense oligonucleotide further comprises at least c
modified nucleobase, preferably a 5-methylcytosine. The antisense
oligonucleotides are useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. New antisense oligonucleotides for modulating never in mitosis, gene a (NIMA) -related kinase 6 expression, useful for diagnosing, preventing or treating diseases associated with the kinase, e.g. hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar modity.
                                                                                                                                                                                                                                                                                                                            Antisense therapy; human; NIMA-related kinase 6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperproliferative disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a microarray (lab on-chip) consisting of a strip-shaped sheet with several cells containing a sample flow path which connects a sample inflow unit and sample draining unit. The microarray of
                                                                                                                                                                                                                                                                                    The present invention relates to determining whether a subject has, or is at risk of developing, a hematopoietic cancer associated with a reduction in wingless-related MMTV integration site 5a (Wht5a) gene expression or activity or protein activity. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the Wht5a, such as hematopoietic cancers like acute and chronic myeloid
                                                                                                                                                Diagnosing and/or treating hematopoietic cancers associated with a reduction in wingless-related MMTV integration site 5a (WntSa) gene or protein activity, particularly in myeloid or lymphoblast leukemia, lymphoma and myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          microarray; lab on-chip; human; ss; PCR; primer; tubulin alpha 2 gene.

                                                                                                                                                                                                                      0
the invention is useful for separating and refining substances. The present DNA sequence represents a PCR primer for the human tubulin alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCCS polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human ABCCS polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human ABCCS DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonuclectide compound that inhibits expression of ABCC5, useful preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ABCC5; ss; antisense oligonucleotide; phosphorothioate linkage;
2'-0-methoxyethyl sugar moiety; 5-methylcytosine;
hyperproliferative disorder; cancer; cytostatic.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCC5 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide phosphorothioate linkage, at least one modified sugar moiety, a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human ABCC5 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human ABCC5 polypeptide of the invention.
                                                                                                                                                                Human, ABCC5; ss; antisense oligonucleotide; phosphorothioate linkage;
2'-0-methoxyethyl sugar moiety; 5-methylcytosine;
hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotide compound that inhibits expression of ABCC5, usefu
for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 2 A; 4 C; 8 G; 6 T; 0 U; 0 Other;

The invention relates to a compound (e.g. an antisense oligonucleotide), having a sequence comprising 8-80 bp targeted to a nucleic acid encoding STAT 6 (signal transducer and activator of transcription 6, a transcription factor implicated in rheumatoid arthritis, obesity and allergy), specifically hybridises with the nucleic acid encoding STAT 6 appearing as App68397 and inhibits expression of STAT 6. Also included are a method of inhibiting inhibits expression of STAT 6. Also included a method of inhibiting a modulator of STAT 6, a diagnostic method for identifying a disease state, a kit or assay device comprising the associated with STAT 6. The oligonucleotide compound is useful for preparing a composition for treating an animal having a disease or condition associated with STAT 6. The oligonucleotide compound is useful for preparing a composition for treating autoimmune disorder, rheumatoid arthritis, allergy or obesity. The gene for STAT 6 is located on chromosome 12q13. The present sequence is an antisense oligonucleotide targeting STAT 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound (e.g. an antisense oligonucleotide), having a sequence comprising 8-80 bp targeted to a nucleic acid encoding STAT 6 (signal transducer and activator of transcription 6, a laterature factor implicated in rheumatoid arthritis, obseity and allergy), specifically hybridises with the nucleic acid encoding STAT 6 appearing as ADP68397 and inhibits expression of STAT 6. Also included are a method of inhibiting the expression of STAT 6. Also included are a method of inhibiting the expression of STAT 6. Also included compound a disease state, a kit or assay device comprising the compound and a method of treating an animal having a disease or condition associated with STAT 6. The oligonucleotide compound is useful for preparing a composition for treating autoimmune disorder, rheumatoid arthritis, allergy or obesity. The gene for STAT 6 is located on chronosome 12013. The present sequence is a STAT 6 is located on chronosome 12013. The present sequence is a STAT 6 cDNA target sequence
                                                 Human; ss; antisense; STAT 6; signal transcription, transcription factor; rheumatoid arthritis; obesity; allergy; autoimmune disorder; chromosome 12q13.
                                                                                                                                                                                                                                                                                                                  New oligonucleotide compound that inhibits expression of STAT 6, useful for preparing a composition for treating e.g. autoimmune disorders.

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding endothelial lipase. The compound specifically hybridises with the nucleic acid molecule encoding endothelial lipase (which comprises a sequence of 3927 bp fully defined in the specification) and inhibits the expression of endothelial lipase.

Also described are: inhibiting the expression of endothelial lipase in cells or tissues; screening for a modulator of endothelial lipase in the approstic method for identifying a disease state; a kit or assay device comprising the above compound; and treating an animal a therapputic or prophylactic amount of the compound so that expression of endothelial lipase is inhibited. The antisense of clipase in cells or tissues to prevent our treat diseases associated with its or prevent or treat diseases associated with the compound so that th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

The compound specifically hybridises with the modelial lipase. The compound of endothelial lipase (which comprises a sequence of 3927 bp fully defined in the specification) and inhibits the expression of endothelial lipase. Also described are: inhibiting the expression of endothelial lipase in cells or tissues; screening for a modulator of endothelial lipase in diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and treating an animal having a disease or comprising the above compound; and treating an animal having a disease or the animal a therapeutic or prophylactic amount of the compound so that expression of endothelial lipase is inhibited. The antisense or lipase in cells or tissues to prevent or treat diseases associated with aberrant endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as treast remains the expression of endothelial contrains the sequence represents a mouse endothelial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This invention describes a novel method for identifying an inhibitor on a gene vital for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene or normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic less one to the intermediate of the contract of the patient and treatment of LOH disorders, e.g. cancers, benigh tumours, endometriosis, polycystic kindey disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-226825 represent human polymorphic sites described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences by computer analysis. Ribozymes directed against these mRNA sequences conclude a computer analysis are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restencies and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a tibozyme that these are lA mRNA means that uses are limited to local delivery, acute indications or ex vivo b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW; Karpeisky A, Kisich K, Matulic-Adamic J, Mcswiggen JA; Pavco P, Beigleman L, Sullivan SM, Sweedler D, Thompson JD; Usman N, Wincott FE, Woolf T; Ribozymes having modified bases and methods for producing them - for use treatment. ```
The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fife.like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expression or mRNA
                                                                                                                                  KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hybridisation probe; differentiation; pathogenic; vaccine strain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      differentially expresent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
Differentiating pathogenic and vaccine strains of cattle brucellosis - using restriction digestion with Nco 1 and transfer of the DNA fragments to filters in an electric field.
                                                                                                                     differentiate between pathogenic and vaccine strains of cattle brucellosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, hybridisation with a labelled sample, and examination of the results. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence appears in the specification, which describes a hybridisation probe used to differentiate between pathogenic and vaccine strains of cattle brucellosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, whybridisation with a labelled sample, and examination of the results. (Updated on 25-MRR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                          Differentiating pathogenic and vaccine strains of cattle brucellosis - using restriction digestion with Nco 1 and transfer of the DNA fragments to filters in an electric field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Probe used to identify pathogenic and vaccine strains of brucellosis.
